

BRICK BOND PATTERNS

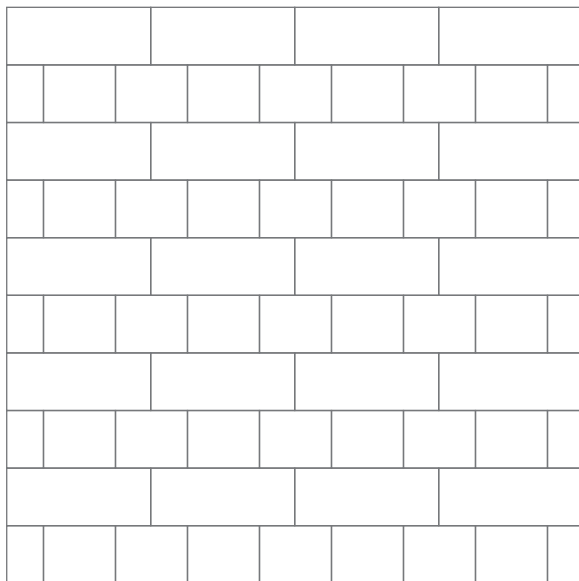

RUNNINGbond

The most used bonding pattern, it's referred to as "running" because the bonding agent is applied in such a way as to create a straight line between the bricks and other materials.

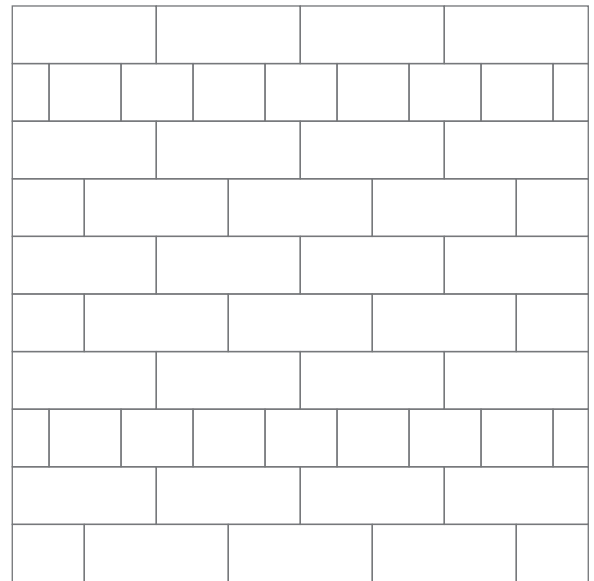

FLEMISHbond

Similar to the Running Bond, the Flemish Bond doesn't alternate layers but instead shifts them. Each row is completed with alternating full-sized and header bricks.

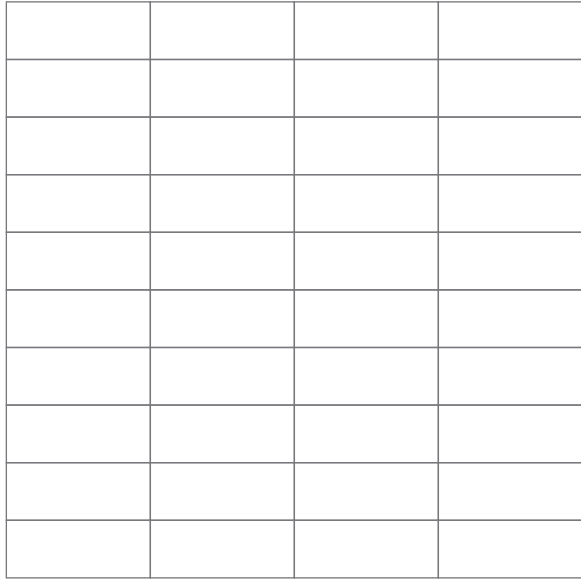

ENGLISHbond

One of the most common brick bonds, it alternates the running bond made with alternating courses of headers and stretchers.

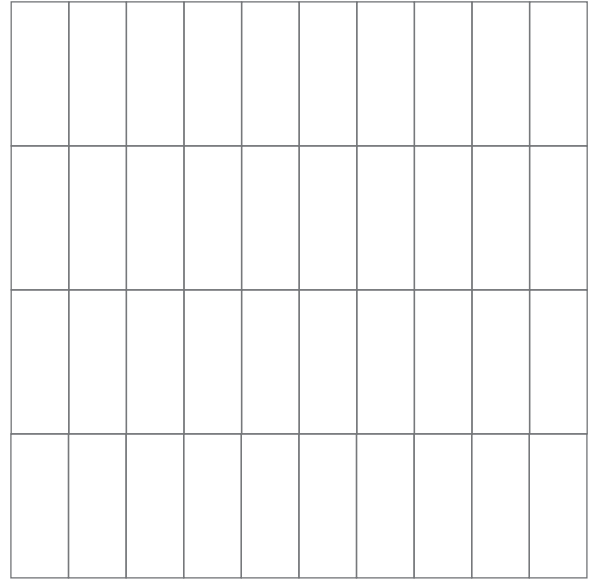

COMMONbond

The Common Bond is similar to the English and Running Bonds, but features a course of headers inserted every five to six layers.

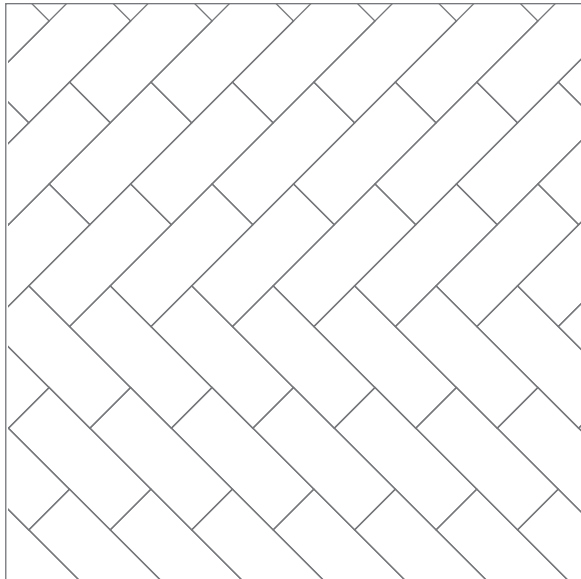

STACKEDbond

Emphasizing the vertical aspect of masonry, a horizontal Stacked (or Stack) Bond can be created with either stretcher or header bricks.

VERTICAL STACKEDbond

Emphasizing the vertical aspect of masonry, a vertical Stacked (or Stack) Bond can be created with either stretcher or header bricks.

HERRINGBONEbond

The herringbone bond resembles a zigzag pattern. It is a type of raking bond - a bond which conceals layers of diagonally laid brick to bond exposed bricks to the wall.
